Paul Foerster wrote the best 2nd year algebra textbook I have ever examined or taught from. As a trained physicist and mathematician with an unusual and delightful sense of humor, Foerster develops the algebra by developing and illustrating the algebra skills in the context of functions. His applications are real-world, meaty and meaningful.

can define difference, product, and ratio functions for any pair of functions that have the same kinds of inputs (not necessarily numbers) and also the same kinds of outputs (which do have to be numbers so that the usual operations of algebra can apply to them, and which also must have the same units or no units when we add and subtract).

Composition of Functions | Algebra and Trigonometry

Algebra and Trigonometry provides a comprehensive and multi-layered exploration of algebraic principles. The text is suitable for a typical introductory Algebra & Trigonometry course, and was developed to be used flexibly. The modular approach and the richness of content ensures that the book meets the needs of a variety of programs.

Trigonometry is the study of triangles, which contain angles, of course. Get to know some special rules for angles and various other important functions, definitions, and translations. Sines and cosines are two trig functions that factor heavily into any study of trigonometry; they have their own formulas and rules that you'll want to understand if [...]

Tips for Teaching Math – Algebra and Trigonometry

except the function notation form, while messier to write, is much more convenient for the types of problem you'll be working in a Calculus class. In this problem we're asked to evaluate some functions. So, in the first case $f(2)$ is asking us to determine the value of $(y = -x^2 + 6x - 11)$ when $(x = 2)$.
