High-performance liquid chromatography (HPLC), formerly referred to as high-pressure liquid chromatography, is a technique in analytical chemistry used to separate, identify, and quantify each component in a mixture. It relies on pumps to pass a pressurized liquid solvent containing the sample mixture through a column filled with a solid adsorbent material.

HPLC Introduction. HPLC stands for High-Performance Liquid Chromatography. Before HPLC was available, LC analysis was carried by the gravitational flow of the eluent (the solvent used for LC analysis) thus required several hours for the analysis to be completed. Even the improvements added in later time we're able to shorten the analysis time slightly.

Reversed-phase chromatography is the most commonly used HPLC separation mode. It is far superior to the other modes in the variety of target compounds it can handle. The dominant phenomenon retaining the sample in the column in reversed-phase chromatography is the hydrophobic interaction between the solid phase and sample. Two

HPLC injection is a technique used to load the sample into the HPLC system. This process is done using a specially designed injection system which is a separate and prominent part of the HPLC system. The most popular injector is the rheodyne injector. The injection is done manually by an external syringe or autoinjector.
