Foundry sand testing is a process used to determine if the foundry sand has the correct properties for a certain casting process. The sand is used to make moulds and cores via a pattern. In a sand casting foundry there are broadly two reasons for rejection of the casting — metal and sand — each of which has a large number of internal variables.

Before the sand is analyzed, a sand splitter is utilized to ensure the sand is thoroughly mixed before a sample is taken. Sand should be split three times to ensure the sand is homogenous (Mold and Test Handbook, 1989)¹. After the sand has been split, a known amount of sand is taken and used for sieve analysis.
