The 1891 Panhard et Levassor is considered a significant advance in automotive transmissions since it used a three-speed manual transmission. [2] [3] This transmission, along with many similar designs that it inspired, was a non-synchronous (also called sliding-mesh ) design where gear changes involved sliding the gears along their shafts so that the desired cogs became meshed.

The powerful two-door coupe can be had with a manual transmission on its 375 HP R/T, 485 HP R/T Scat Pack, and tire-melting 717 HP Hellcat models. That Hellcat will get you to 60 MPH in the three-second range and to 100 MPH in just over seven seconds (but only on a racetrack, of course). We hear they can do some sweet burnouts, too.

Manual transmissions in modern passenger cars use synchronizers, or synchros, to eliminate the need for double-clutching. A synchro's purpose is to allow the collar and the gear to make frictional contact before the dog teeth make contact. This lets the collar and the gear synchronize their speeds before the teeth need to engage, like this:

There are two fundamental types of motor vehicle transmission: Manual - the driver has to perform each gear change (i.e., the driver is required to shift gears) Automatic - once placed in drive (or any other 'automatic' selector position), it selects the gear ratio dependent on engine speed and load automatically.

A sequential manual transmission (like the kind of gearbox used on a fully-manual motorcycle) is a type of non-synchronous manual transmission, which only allows the driver to select either the next gear (e.g., shifting from second gear to first gear) or the previous gear (e.g. shifting from second gear to third gear), in succession. This restriction avoids accidentally selecting the wrong ...
