This is good, since it means that quantum mechanics is driving the result. For $m = 0.1$ kg, find $m^2gL^3/h^2 = 1064$, and so $T = 0.1$ sec $\times (147/4 - 4) \sim 3$ sec. I'd say that's a surprising and...

The density matrix allows the solution of certain time-dependent problems in quantum mechanics. Von Neumann measurement scheme [edit] The von Neumann measurement scheme , the ancestor of quantum decoherence theory, represents measurements projectively by taking into account the measuring apparatus which is also treated as a quantum object.

Quantum mechanics arose gradually, from theories to explain observations which could not be reconciled with classical physics, such as Max Planck's solution in 1900 to the black-body radiation problem, and the correspondence between energy and frequency in Albert Einstein's 1905 paper which explained the photoelectric effect.

Books on quantum mechanics can be grouped into two main categories: textbooks, where the focus is on the formalism, and purely problem-solving books, where the emphasis is on applications. While many fine textbooks on quantum mechanics exist, problem-solving books are fewer.

Quantum mechanics is based on Schrödinger's wave equation and its solution. The solution of the wave equation brings the idea of shells, sub-shells and orbitals. The probability of finding an electron at a point within an atom is proportional to the $|\psi|^2$ at that point, where ψ represents the wave-function of that electron.

In 1952 David Bohm adapted Louis DeBroglie's pilot wave theory, producing Bohmian mechanics, the first successful hidden variables interpretation of quantum mechanics. This theory, which posits an additional dynamical wave describing the position of a quantum particle, removes the concept of wave function collapse from his interpretation of quantum theory.
