Part II (chapters 5 to 10) is an introduction to Riemannian geometry as required by general relativity. This is done from the beginning, starting with vectors and tensors. I believe that students of physics grasp physical concepts better if they are not shaky about the mathematics involved.

Thus, for example, the path of a planet orbiting around a star is the projection of a geodesic of the curved 4-dimensional spacetime geometry around the star onto 3-dimensional space. A curve is a geodesic if the tangent vector of the curve at any point is equal to the parallel transport of the tangent vector of the base point.

Last year, when I was at my Dad's and stepmom's house, I found the book "An Introduction to General Relativity, Spacetime and Geometry", by Sean M Carroll. I was struck by the promise at the beginning of the preface: "... it is an unalloyed joy to finally reach the point in one's studies where these phenomena may be understood in a rigorous quantitative level.
