## STRONG INTERACTIONS OF HADRONS

The strong interaction is a gauge interaction mediated by a massless, spin 1 gluon,  $g$ , which is electrically neutral but carries a composite colour such as red-blue. The coupling constant is known as  $\alpha_s$  (alpha-

Hadrons. Particles that interact by the strong interaction are called hadrons. This general classification includes mesons and baryons but specifically excludes leptons, which do not interact by the strong force. The weak interaction acts on both hadrons and leptons.

String theory was originally developed during the late 1960s and early 1970s as a never completely successful theory of hadrons, the subatomic particles like the proton and neutron that feel the strong interaction.

Physics And Cosmology

In nuclear physics and particle physics, the strong interaction is the mechanism responsible for the strong nuclear force, and is one of the four known fundamental interactions, with the others being electromagnetism, the weak interaction, and gravitation. At the range of  $10^{-15}$  m, the strong force is approximately 137 times as strong as electromagnetism, a million times as strong as the weak interaction, and  $10^38$  times as strong as gravitation. Because all hadrons interact by the strong interaction, and yet they can decay into leptons (i.e. in Beta + or - decay) and I thought leptons only felt the weak interaction. So do hadrons "interact" by the strong interaction (and by "interaction", I'm guessing it means they feel the force), and
