Jonathan WeinerThe Beak of the Finch : A Story of Evolution in Our Time. "Darwin's finches are not like Michelangelo's Adam, who raises his finger languidly to meet the down-stretched finger of God: the first man, molded of clay, half-raised from earth, created in an instant. These birds are more like Michelangelo's Prisoners, the famous statues he left half in and half out of the marble, so that looking at them today we can almost see and hear the sculptor's chisel at work.

British Finches: An Identification Guide - Woodland Trust
Finches are small birds with forked or notched tails, moderately pointed wings, rounded or elongated bodies and round heads, with more or less triangular bills. The bill shape varies according to the principal type of food, from short and rounded to rather long and sharp. Some species are agile and feed while perching on, or hanging from, plants. Others are essentially ground feeders.

Beaks of warbler finches are thinner and more pointed than both. These adaptations make them more fit to survive on available food. Researchers at Harvard Medical School have taken the story one step further. Using modern genetic analyses, they found a molecule that regulates genes involved in shaping the beaks of Darwin finches.
