solution [ s -l sh n ] Chemistry A mixture in which particles of one or more substances (the solute) are distributed uniformly throughout another substance (the solvent), so that the mixture is homogeneous at the molecular or ionic level. The particles in a solution are smaller than those in either a colloid or a suspension.

A solution is a liquid or solid which is made by dissolving a solid, liquid, or gas in the pure liquid or solid. A solution which does not dissolve any more solute is described as being supersaturated. When the solvent has dissolved as much solute as it can, it is a saturated solution.

**Solution definition and meaning** | **Collins English Dictionary**

In chemistry, a solution is a homogeneous mixture composed of only one phase. In such a mixture, a solute is a substance dissolved in another substance, known as a solvent. The solvent does the dissolving.

**What does SOLUTION mean?** —Definitions

A solution is a homogeneous mixture of two or more substances. A solution may exist in any phase . A solution consists of a solute and a solvent. The solute is the substance that is dissolved in the solvent. The amount of solute that can be dissolved in solvent is called its solubility.

One Solution: When a system of equations intersects at an ordered pair, the system has one solution. Infinite Solutions: Sometimes the two equations will graph as the same line, in which case we have an infinite number of solutions.

For example: You want to make a 5 gallon solution to use in a mop bucket. You want it diluted 1-10 because that 's what the instructions indicate for your particular use. To calculate how much product to put into the mop bucket you take 5 gallons and divide it by the total number of parts, which is 11 (1 part product + 10 parts water).

· One solution. In this case the two equations describe lines that intersect at one particular point. Clearly this point is on both lines, and therefore its coordinates (x, y) will satisfy the equation of either line. Thus the pair (x, y) is the one and only solution to the system of equations. 2. A molar solution is defined as an aqueous solution that contains 1 mole (gram-molecular weight) of a compound dissolved in 1 liter of a solution. In other words, the solution has a concentration of 1 mol/L or a molarity of 1 (1M). Physicists and chemists typically use this parameter to express concentrations of various substances.

**What is a Molar Solution?** —Definition from Corrosionpedia

A solution is a homogeneous mixture of two substances—that is, it has the same distribution of particles throughout. Technically speaking, a solution consists of a mixture of one or more solutes dissolved in a solvent. The particles of solute and solvent are molecules or ions, with one or more solvent molecules bound to each solute particle.

Does it mean take one part solution X and add ten parts water, or does it mean take one part solution X and bring the volume to a total of ten parts? A biologist would likely apply the second definition to a buffer or reagent solution. In another discipline, though, the former definition might be more relevant.

The definition of a supersaturated solution is one which contains more dissolved solute than could ordinarily dissolve into the solvent. A minor disturbance of the solution or introduction of a "seed" or tiny crystal of solute will force crystallization of excess solute. One way supersaturation can occur is by carefully cooling a saturated ...

**Saturated Solution Definition and Examples**

A solution is a liquid mixture where a smaller amount of a substance called a solute is mixed into a larger amount of a solvent like water. A solution with a great deal of solute is concentrated while a solution with a smaller amount of solute is dilute.
